Title : Rare Arrhythmias, Connected with Disturbed Conductivity and  
Observed at Poisoning with Digitalis. About Two Clinical Cases

Orig Pub : Med. interna, 1957, 9, No 3, 432-438

Abstract : A patient 32 years old with cardiac insufficiency as a result of rheumatic mitral stenosis after treatment with digitalis experienced an atrioventricular blockage of first degree and an isorhythmical atrioventricular dissociation. Three days after the end of the treatment auricular fibrillation set in, and on the fifth day the sinus rhythm was restored. A patient, 73 years old, suffering from atherosclerosis, experienced after digitalis treatment an atrioventricular blockage 2:1, an arrhythmia, similar to the Luciani-Venkenbach periods but with a reverse sequence, changes in the form of the indent R, and then a return to the regular sinus rhythm. The arrhythmias had a functional nature and were determined by an increased parasympathetic tone and metabolic disturbances

849. THE PATHOGENESIS OF RHEUMATIC ENDOCARDITIS - Considérations sur la pathogénie de l'endocardite rhumatismale - Dimitriu Ch.G., Georgesco L. and Dimitriu M. Bucarest - ARCH. MAL. COEUR 1957, 50/4 (285-303) illus. 7

No explanation is offered of the mechanism bringing about the initial lesions of the endothelium nor of the reason why no embolic complications occur, and the action of cortisone on the endocarditic process cannot be explained either. The modern

8.47

conception of the pathogenesis of this disease is, on the other hand, based on the study of capillary permeability and on histochemical studies in the endocardium. Such studies have revealed the presence of marked alterations of capillary permeability and of lesions of the type of mucoid and fibrinoid degeneration; the latter finding constitutes an argument against the theory of initial necrosis of the endothelium and of subsequent fibrin deposition. The authors have carried out studies in this field and have demonstrated and confirmed the presence of characteristic lesions in a histochemical investigation of the changes of the ground substance, of its mucoprotein complexes, and of the fibrils of the connective tissue: collagenous, elastic or reticular. In conclusion of this investigation, in which 10 cases were studied, it is stated that the formation of rheumatic growths is a subendothelial process and not a secondary process, and that it affects the valves in the first place.

"Lipid Metabolism and the Overstrain of CNS (A Study of Telephone Operators) Summary."

Prague, Activitas Nervosa Superior, Vol 5, No 4, 1963, p 403

Abstract: Numerous studies of neurosis occurring in telephone operators were made. Their work is performed under conditions of nervous strain. Lipid metabolism and its possible role in the pathogenesis of arterosclerosis was studied. Lipid values before work and after 3 hours were compared. Cholesterolemia, the lipoprotein ratio and Kunkel test with formol were made.

Biochemical indices did not differ significantly from those in the control group (sanitary workers); the 3 hours did not result in clear changes in the lipid metabolism. No relation was found between the length of service and the blood cholesterol level. No references. Submitted at the Medical Congress in Prague, November 1962.
